

Q(1) Write a python program to enter your full name and print your initial.

```
# taking input from user
name = input("Enter your full name: ")

# Print the initials
initials = "".join(word[0].upper() for word in name.split())

#display output
print("Your initials are:", initials)
```

#final output

```
Enter your full name: ravi kumar raj
Your initials are: RKR
```

#(2) Write a python program to enter two names from keyboard and check whether both are equal or not?

```
# taking input from user
name1 = input("Enter first name: ")
name2 = input("Enter second name: ")
```

```
if name1 == name2:
    print("Both names are equal")
else:
    print("Both names are not equal")
```

```
Enter first name: ravi
Enter second name: ravi
Both names are equal
```

#(3) Write a python program to enter a string and check whether it is palindrome or not ?

```
string = input("Enter a string: ")

if string == string[::-1]:
    print("The string is a palindrome")
else:
    print("The string is not a palindrome")
```

#Output

```
Enter a string: ravi
The string is not a palindrome
```

#(4) Write a python program to print as following :

#Input : Hi

#Output : HHii

```
'''
```

```
val = input("enter hi :-")
print("output = "+"H",val+"i")
```

```
'''
```

```
string = input("Enter a string: ")
```

```
for ch in string:
    print(ch * 2, end="")
```

#Output

```
Enter a string: hi
hhi
```

#Q.5 Write a python program to count given character in given string

#Take Input : Hello ! How are you ?

```
string = input("Enter a string: ")
```

#Character to find : H

```
char = input("Character to find: ")
```

#Find Number Of Character as Output = 2

```
count = string.count(char)
```

```
print("Output:", count)
```

#Final output

```
Enter a string: hello ! how are you
Character to find: h
Output: 2
```

#Q Write a python program to enter two strings and prepare a new string by combining both the, strings in following manner :

#Input String one : abc

```
val1 = input("input 1st string :-")
```

#Input string two : xyz

```
val2 = input("input 2nd string :-")
```

```
output = val1+val2
```

```
print("output = ",output) #output as : axbycz
```

#final output

```
input 1st string :-abc
input 2nd string :-xyz
output =  abcxyz
```

#(7) Write a python program to perform following operation :

#Input String : Hello

```
string = input("Input String: ")
```

#Input a character : X

```
char = input("Input a character: ")
```

#Input number of times : 3

```
n = int(input("Input number of times: "))
```

```
output = (string + char) * n
```

```
print("Output:", output)    #Output : HelloXHelloXHello
```

#final output

```
Input String: hello
Input a character: x
Input number of times: 3
Output: helloxhelloxhellox
```

"""

(8) Write a python program to enter a string from keyboard and count number of Vowels and No.of consonants. Also give percentage of both.

"""

```
string = input("Enter a string: ")
```

```

vowels = 0
consonants = 0

for ch in string:
    if ch.isalpha():

        if ch.lower() in "aeiou":
            vowels += 1
        else:
            consonants += 1

total = vowels + consonants

vowel_percentage = (vowels / total) * 100
consonant_percentage = (consonants / total) * 100

print("Number of Vowels:", vowels)
print("Number of Consonants:", consonants)

print("Percentage of Vowels:", vowel_percentage, "%")
print("Percentage of Consonants:", consonant_percentage, "%")

#final output

Enter a string: ravi kumar raj
Number of Vowels: 5
Number of Consonants: 7
Percentage of Vowels: 41.66666666666667 %
Percentage of Consonants: 58.333333333333336 %

```

```
"""
```

(9) Write a python program to enter a string, character to replace and replacement character. Output will be new string.

```
"""
```

```
#take input as : Hello ! How are you ?
```

```
string = input("Enter a string: ")
```

```
# Character to replace : H
```

```
char = input("Character to replace: ")
```

```
# Replacement Character : P
```

```
replacement = input("Replacement Character: ")
```

```
new_string = string.replace(char, replacement)
```

```
print("Output:", new_string)      #Output : Pello ! Pow are you ?
```

```
#final output
```

```

Enter a string: hello how are you
Character to replace: h
Replacement Character: p
Output: pello pow are you

```

```
"""
```

(10) Write a python program to count the digits in given string and also give sum of digits. If no digits

available in string print 0.

Input : Hello123World

Output : No. of digits : 3

Sum of digits : 6

Input : HelloWorld

Output : 0

```
"""
```

```
string = input("Enter a string: ")
```

```
count = 0
```

```
sum_digits = 0
```

```
for ch in string:
```

```
    if ch.isdigit():
```

```
        count += 1
```

```
        sum_digits += int(ch)
```

```
if count == 0:
```

```
    print("0")
```

```
else:
```

```
    print("No. of digits:", count)
```

```
    print("Sum of digits:", sum_digits)
```

```
#final output
```

```
Enter a string: hello123world
No. of digits: 3
Sum of digits: 6
```
